# Getting real...

- Creating a small *MoodTracker* app that displays a list of friends in a table view
- each friend has a **mood** that can be toggled with a tap on the button that displays the mood symbol (😄😐😡)
- **Goal:** implement a *proper information flow* according to the MVC pattern
- Note: you'll learn about usage of enums and different communication patterns along the way

# Direct Method Invocation

fancy term for **method call**

simplest form to **make objects communicate**

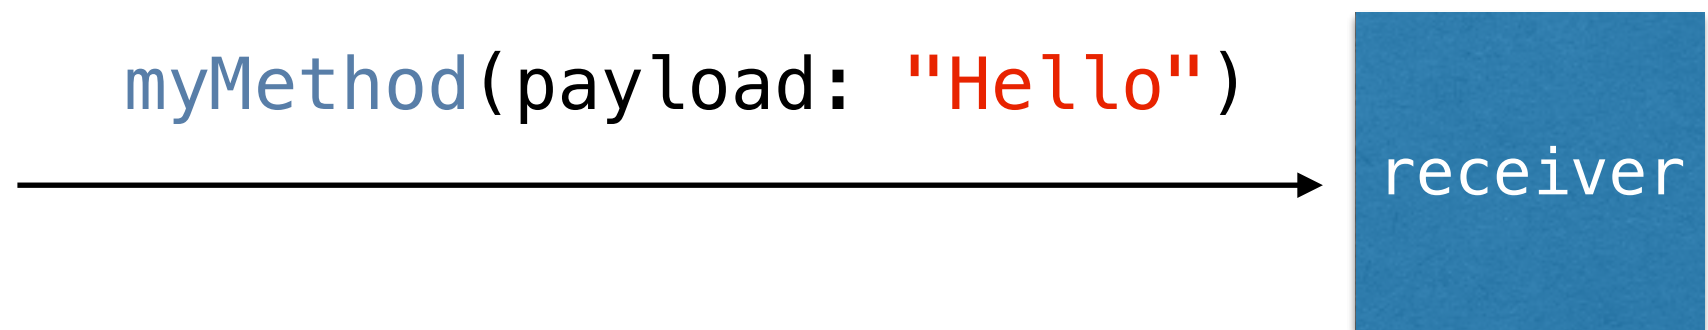

**calling method** on an object = **send message** to that object

# Direct Method Invocation

```
class Receiver {  
    func myMethod(payload: String) {  
        // ...  
    }  
}  
  
let receiver = Receiver()  
receiver.myMethod(payload: "Hello")
```

**NOTE:**  
**The receiver  
implements  
the method**

# Direct Method Invocation

```
class Calculator {  
    func add(a: Int, b: Int) -> Int {  
        return a+b  
    }  
}
```

# Controller

FriendsTableViewController

2

OK, I update the  
friend's mood

3

the friend's mood  
changed, **view** needs  
to look different now

my friend  
got tapped

1

Friend
